When the *New Horizons* spacecraft whizzed by Pluto in 2015, we Earthlings were dazzled by the breathtaking images it beamed home. They revealed a never-before-seen alien landscape—a world of mountains made of ice mixed with plains of frozen-solid methane and nitrogen. After more than two years of poring over the data, NASA has made remarkable new discoveries about everyone's favorite dwarf planet. But *New Horizons* didn't stop there. On New Year's Day 2019, the probe flew by an object known now as Ultima Thule, believed to be a primordial building block of the solar system. This is the most distant flyby in NASA's history—4 billion miles from Earth. NOVA takes action as NASA uncovers the secrets of what lies beyond Pluto.
